VIEWS

# Agenda

0. Class imbalance (ctd.)
1. Data augmentation
2. Learned features vs. engineered features
3. Breakout exercise
4. Common feature engineering ops
5. Data leakage

## **Class imbalance (ctd.)**

# Class imbalance is the norm

- Fraud detection
- Spam detection
- Disease screening
- Churn prediction
- Resume screening
  - E.g. 2% of resumes pass screening
- Object detection
  - Most bounding boxes don't contain any object

People are more interested in unusual/potentially catastrophic events

# Sources of class imbalance

- Sampling biases
  - Narrow geographical areas (self-driving cars)
  - Selection biases
- Domain specific
  - Costly, slow, or infeasible to collect data of certain classes
- Labeling errors

# How to deal with class imbalance

1. Choose the right metrics
2. Data-level methods
3. Algorithm-level methods

# 1. Choose the right metrics

Which model would you choose?

Model A vs. Model B confusion matrices

Model A	Actual CANCER	Actual NORMAL
Predicted CANCER	10	10
Predicted NORMAL	90	890

Model B	Actual CANCER	Actual NORMAL
Predicted CANCER	90	90
Predicted NORMAL	10	810

# Choose the right metrics

Model A vs. Model B confusion matrices

Model B has a better chance of telling if you have cancer

Model A	Actual CANCER	Actual NORMAL
Predicted CANCER	10	10
Predicted NORMAL	90	890

Model B	Actual CANCER	Actual NORMAL
Predicted CANCER	90	90
Predicted NORMAL	10	810

Both have the same accuracy: 90%

# Symmetric metrics vs. asymmetric metrics

Symmetric metrics	Asymmetric metrics
Treat all classes the same	Measures a model's performance w.r.t to a class
Accuracy	F1, recall, precision, ROC

$$\text{Accuracy} = \frac{(TP + TN)}{(TP + FP + TN + FN)}$$

$$F_1\text{-score} = 2 \times \frac{\text{Precision} \times \text{Recall}}{\text{Precision} + \text{Recall}} = \frac{2TP}{2TP + FP + FN}$$

- TP: True positives
- TN: True negatives

- FP: False positives
- FN: False negatives

# Class imbalance: asymmetric metrics

- Your model's performance w.r.t to a class

	CANCER (1)	NORMAL (0)	Accuracy	Precision	Recall	F1
Model A	10/100	890/900	0.9	0.5	0.1	0.17
Model B	90/100	810/900	0.9	0.5	0.9	0.64

⚠ F1 score for CANCER as 1  
is different from F1 score for  
NORMAL as 1 ⚠

## 2. Data-level methods: Resampling

Undersampling	Oversampling
Remove samples from the majority class	Add more examples to the minority class

## 2. Data-level methods: Resampling

Undersampling	Oversampling
Remove samples from the majority class	Add more examples to the minority class
Can cause loss of information	Can cause overfitting

# Undersampling: Tomek Links

- Find pairs of close samples of opposite classes
- Remove the sample of majority class in each pair
  - Pros: Make decision boundary more clear
  - Cons: Make model less robust

# Oversampling: SMOTE

- Synthesize samples of minority class as convex (~linear) combinations of existing points and their nearest neighbors of same class.

# Oversampling: SMOTE

Both SMOTE and Tomek links only work on low-dimensional data!

- Synthesize samples of minority class as convex (~linear) combinations of existing points and their nearest neighbors of same class.

### 3. Algorithm-level methods

- Naive loss: all samples contribute equally to the loss
- Idea: training samples we care about should contribute more to the loss

$$L(X; \theta) = \sum_x L(x ; \theta)$$

### 3. Algorithm-level methods

- Cost-sensitive learning
- Class-balanced loss
- Focal loss

# Cost-sensitive learning

- $C_{ij}$ : the cost if class  $i$  is classified as class  $j$

	Actual NEGATIVE	Actual POSITIVE
Predicted NEGATIVE	$C(0, 0) = C_{00}$	$C(1, 0) = C_{10}$
Predicted POSITIVE	$C(0, 1) = C_{01}$	$C(1, 1) = C_{11}$

- The loss caused by instance  $x$  of class  $i$  will become the weighted average of all possible classifications of instance  $x$ .

$$L(x ; \theta) = \sum_j C_{ij} P(j | x; \theta)$$

# Class-balance loss

- Give more weight to rare classes

Non-weighted loss

$$L(X; \theta) = \sum_i L(x_i; \theta)$$

Weighted loss

$$L(X; \theta) = \sum_i W_{y_i} L(x_i; \theta)$$

$$W_c = \frac{N}{\text{number of samples of class } C}$$

```
model.fit(features, labels, epochs=10, batch_size=32, class_weight={"fraud": 0.9, "normal": 0.1})
```

# Focal loss

- Give more weight to difficult samples:
  - downweights well-classified samples

$$p_t = \begin{cases} p & \text{if } y = 1 \\ 1 - p & \text{otherwise,} \end{cases}$$

$$\text{CE}(p_t) = -\log(p_t)$$

$$\text{FL}(p_t) = -(1 - p_t)^\gamma \log(p_t)$$

# 1. Data augmentation

“Data augmentation is the  
new feature engineering”

- Josh Wills, prev Director of Data Engineering @ Slack

# Data augmentation: goals

- Improve model's performance overall or on certain classes
- Generalize better
- Enforce certain behaviors

# Data augmentation

1. Simple label-preserving transformation
2. Perturbation
3. Data synthesis

# Label-preserving: Computer Vision

Random cropping, flipping,  
erasing, etc.

Image from [An Efficient Multi-Scale Focusing Attention Network for Person Re-Identification](#) (Huang et al., 2021)

# Label-preserving: NLP

Original sentences	I'm so happy to see you.
Generated sentences	I'm so <b>glad</b> to see you. I'm so happy to see <b>y'all</b> . I'm <b>very</b> happy to see you.

# Perturbation: neural networks can be sensitive to noise

- 67.97% Kaggle CIFAR-10 test images
- 16.04% ImageNet test images

can be misclassified by changing just one pixel  
([Su et al.](#), 2017)

# Perturbation: Computer Vision

- Random noise
- Search strategy
  - [DeepFool](#) (Moosavi-Dezfooli et al., 2016): find the minimal noise injection needed to cause a misclassification with high confidence.

Whale

Turtle  
noise by  
DeepFool

Turtle  
noise by fast  
gradient sign

# Perturbation: NLP

- Random replacement
  - e.g. BERT ( $10\% * 15\% = 1.5\%$ )
- 80% of the time: Replace the word with the [MASK] token, e.g., my dog is hairy → my dog is [MASK]
- 10% of the time: Replace the word with a random word, e.g., my dog is hairy → my dog is apple
- 10% of the time: Keep the word unchanged, e.g., my dog is hairy → my dog is hairy. The purpose of this is to bias the representation towards the actual observed word.

# Data synthesis: NLP

- Template-based
  - Very common in conversational AI
- Language model-based

Template	Find me a [CUISINE] restaurant within [NUMBER] miles of [LOCATION].
Generated queries	<ul style="list-style-type: none"><li>● Find me a <b>Vietnamese</b> restaurant within <b>2</b> miles of <b>my office</b>.</li><li>● Find me a <b>Thai</b> restaurant within <b>5</b> miles of <b>my home</b>.</li><li>● Find me a <b>Mexican</b> restaurant within <b>3</b> miles of <b>Google headquarters</b>.</li></ul>

# Data Synthesis: Computer Vision

- Mixup
  - Create convex combination of samples of different classes
    - Labels: cat [3], dog [4]
    - Mixup: 30% dog, 70% cat [ $0.3 * 3 + 0.7 * 4 = 3.7$ ]

# Data Synthesis: Computer Vision

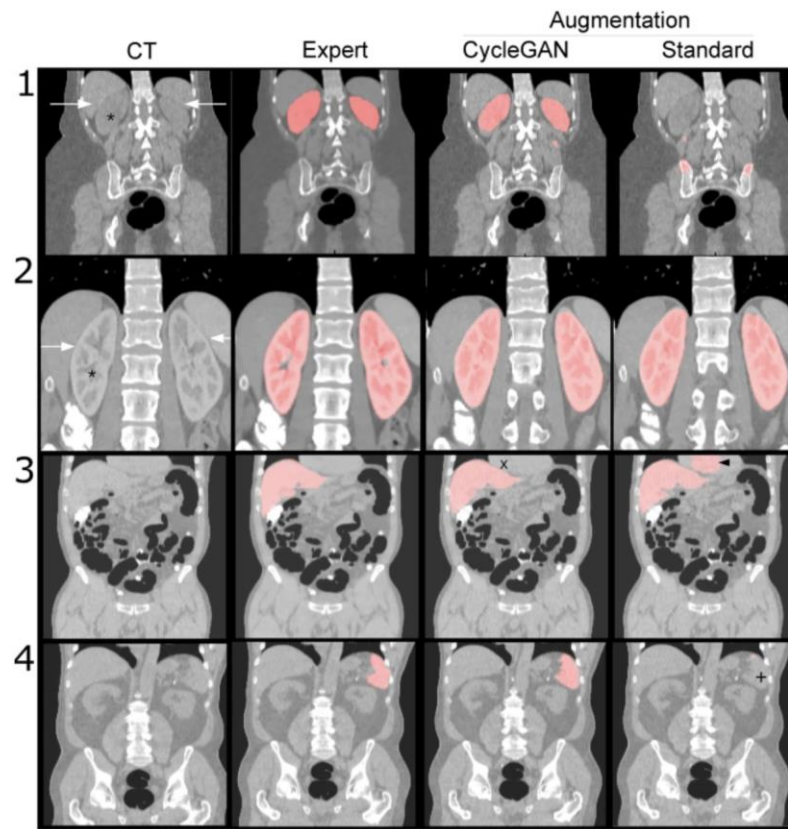

- Mixup
  - Incentivize models to learn linear relationships
  - Improves generalization on speech and tabular data
  - Can be used to stabilize the training of GANs

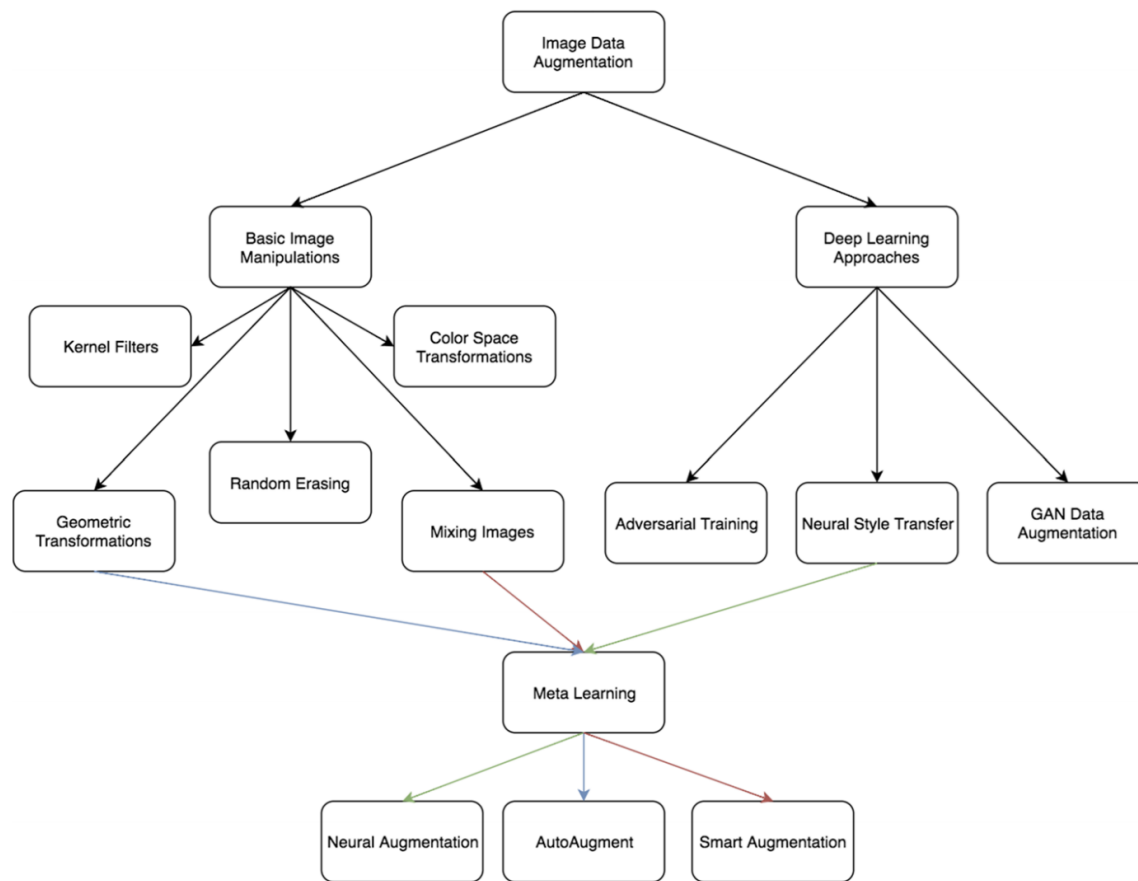

# Data augmentation: GAN

Example: kidney segmentation with data augmentation by CycleGAN

**Fig. 2** A taxonomy of image data augmentations covered; the colored lines in the figure depict which data augmentation method the corresponding meta-learning scheme uses, for example, meta-learning using Neural Style Transfer is covered in neural augmentation [36]

**Learned features  
vs.  
engineered features**

# Feature engineering

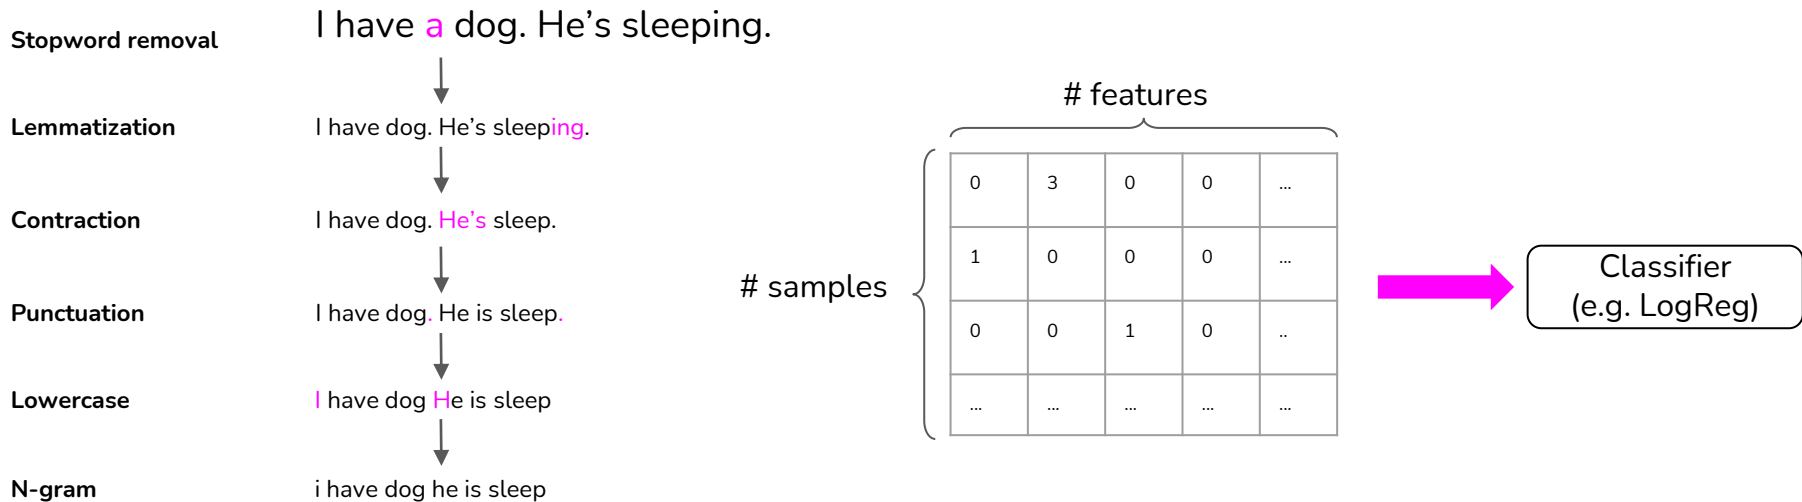

Wait, doesn't deep learning promise no more feature engineering?

# Feature engineering

Wait, doesn't deep learning promise no more feature engineering?

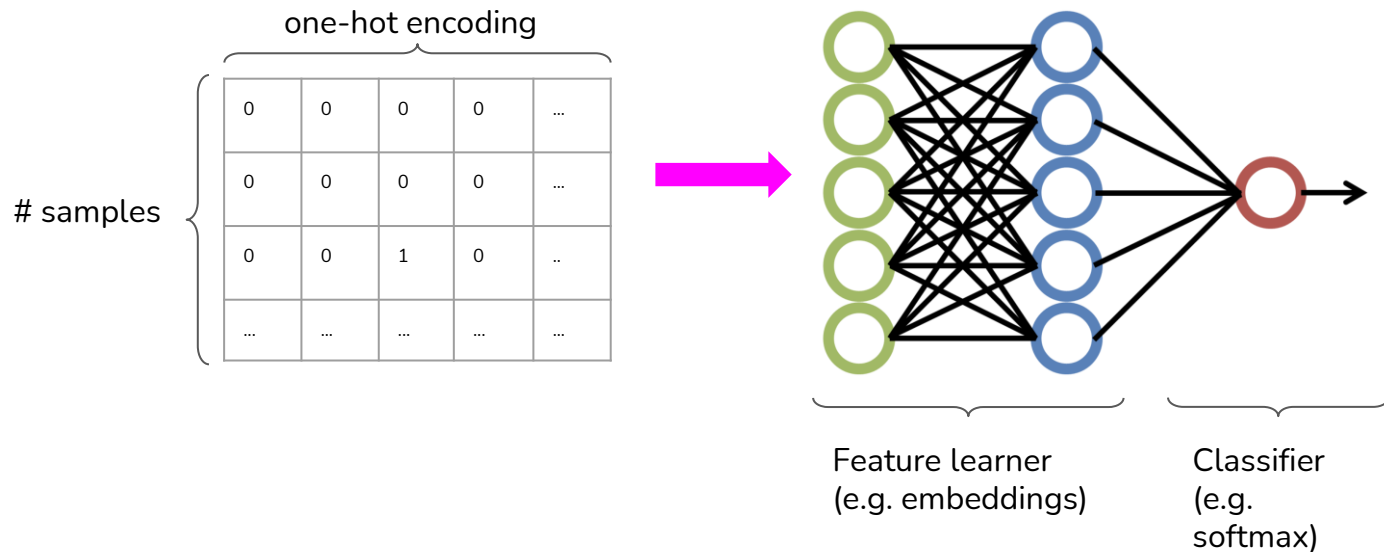

- We're still very far from that point
- Many ML models in industry aren't deep learning

# Engineered features: text

Features	I	you	have	dog	cat	he	she	is	they	sleep	I, have	have, dog	good, dog	...
	1	0	1	1	0	1	0	1	0	1	1	1	0	...

# Learned features: text

**Text** I have a dog. He's sleeping.

One-hot	I	you	have	dog	cat	he	she	is	they	sleep	mom	food	yes	...
	1	0	1	1	0	1	0	1	0	0	0	0	0	...

# Learned features: spam classification

Comment ID	Time	User	Text	# 	# 	Link	# img	Thread ID	Reply to	# replies	...
93880839	2020-10-30 T 10:45 UTC	gitrekt	Your mom is a nice lady.	1	0	0	0	2332332	n0tab0t	1	...

# Feature engineering: spam classification

Even more features:

- Post frequency, max posts per day
- Post repetitiveness
- Language detection, typos, abnormal punctuations, ratio uppercase/lowercase
- IP, other users from the same IP
- NSFW words, blacklisted links
- Targeted users
- ...

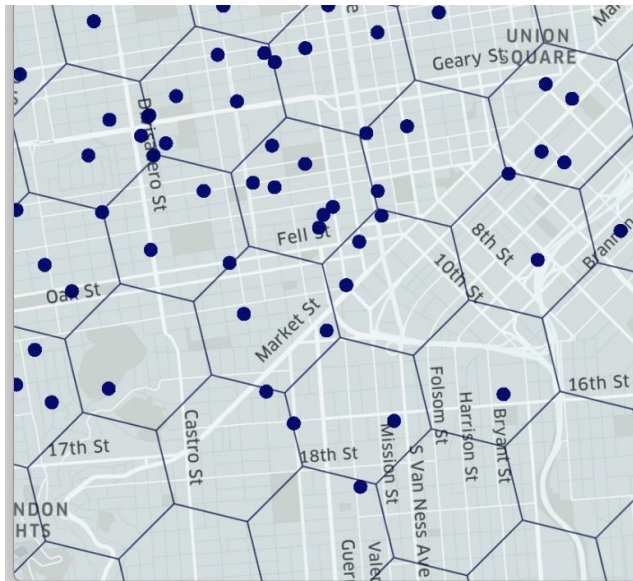

# Feature engineering

- For complex tasks, number of features can go up to millions!
- Lots of ML production work involves coming up with new features
  - Fraudsters come up with new techniques very fast, so need to come up with new features very fast to counter
- Often require subject matter expertise

# Breakout exercise

# Group of 4, 10 minutes

- Imagine you're building a model to predict the trip duration given a pickup and a drop-off location. What features would you use?
- Things to consider:
  - The distance between 2 points is not the same the distance between 2 locations on the map
  - Uber divides their maps into many hexagons
  - Events/environments that can affect a trip duration
  - What features you can pull from a database?
  - What features would you need to compute in (near) real-time?

[Inspired by [Kaggle's taxi trip duration dataset](https://www.kaggle.com/UberData/taxi-trip-duration-dataset)]

# Feature engineering operations

# Common feature engineering ops

1. Handling missing values
2. Scaling
3. Discretization
4. Categorical features
5. Feature crossing
6. Positional embeddings

# Handling missing values

- Not all missing values are equal
  - Missing not at random (MNAR)
  - Missing at random (MAR)
  - Missing completely at random (MCAR)

# Handling missing values

Missing not at random – when a value is missing due to the value itself

ID	Age	Gender	Annual income	Marital status	Number of children	Job	Buy?
1		A	150,000		1	Engineer	No
2	27	B	50,000			Teacher	No
3		A	100,000	Married	2		Yes
4	40	B	(\$350,000?)		2	Engineer	Yes
5	35	B	(\$350,000?)	Single	0	Doctor	Yes
6		A	50,000		0	Teacher	No
7	33	B	60,000	Single		Teacher	No
8	20	B	10,000			Student	No

# Handling missing values

Missing at random – when a value is missing due to another observed variable

ID	Age	Gender	Annual income	Marital status	Number of children	Job	Buy?
1		A	150,000		1	Engineer	No
2	27	B	50,000			Teacher	No
3		A	100,000	Married	2		Yes
4	40	B			2	Engineer	Yes
5	35	B		Single	0	Doctor	Yes
6		A	50,000		0	Teacher	No
7	33	B	60,000	Single		Teacher	No
8	20	B	10,000			Student	No

# Handling missing values

Missing completely at random – there is no pattern to which values are missing

ID	Age	Gender	Annual income	Marital status	Number of children	Job	Buy?
1		A	150,000		1	Engineer	No
2	27	B	50,000			Teacher	No
3		A	100,000	Married	2		Yes
4	40	B			2	Engineer	Yes
5	35	B		Single	0	Doctor	Yes
6		A	50,000		0	Teacher	No
7	33	B	60,000	Single		Teacher	No
8	20	B	10,000			Student	No

# Handling missing values

- Deletion – removing data with missing entries
- Imputation – filling missing fields with certain values

Many people prefer deletion not because it's better, but it's easier to do

# Handling missing values

- Deletion

- Column deletion – remove columns with too many missing entries
  - drawbacks – even if half the values are missing, the remaining data still potentially useful information for predictions
  - e.g. even if over half the column for 'Marital status' is missing, marital status is still highly correlated with house purchasing
- Row deletion

Marital status
Married
Single
Single

# Handling missing values

- Deletion
  - Column deletion
  - Row deletion

# Handling missing values

- Row deletion
  - Good for: data missing completely at random (MCAR) and few values missing

ID	Age	Gender	Annual income	Marital status	Number of children	Job	Buy?
1	39	A	150,000	Married	1	Engineer	No
2	27	B	50,000	Single	0	Teacher	No
3		A	100,000	Married	2		Yes
4	40	B	75,000	Married	2	Engineer	Yes
5	35	B	35,000	Single	0	Doctor	Yes
6	32	A	50,000	Married	0	Teacher	No
7	33	B	60,000	Single	2	Teacher	No
8	20	B	10,000	Single	1	Student	No

# Handling missing values

- Row deletion
  - Bad when many examples have missing fields

ID	Age	Gender	Annual income	Marital status	Number of children	Job	Buy?
1		A	150,000		1	Engineer	No
2	27	B	50,000			Teacher	No
3		A	100,000	Married	2		Yes
4	40	B			2	Engineer	Yes
5	35	B		Single	0	Doctor	Yes
6		A	50,000		0	Teacher	No
7	33	B	60,000	Single		Teacher	No
8	20	B	10,000			Student	No

# Handling missing values

- Row deletion
  - Bad for: missing values are not at random (MNAR)
  - Missing information is information itself

ID	Age	Gender	Annual income	Marital status	Number of children	Job	Buy?
1		A	150,000		1	Engineer	No
2	27	B	50,000			Teacher	No
3		A	100,000	Married	2		Yes
4	40	B	(\$350,000?)		2	Engineer	Yes
5	35	B	(\$350,000?)	Single	0	Doctor	Yes
6		A	50,000		0	Teacher	No
7	33	B	60,000	Single		Teacher	No
8	20	B	10,000			Student	No

# Handling missing values

- Row deletion
  - Bad for: missing data at random (MAR)
  - Can potentially bias data – we've accidentally removed all examples with gender 'A'

ID	Age	Gender	Annual income	Marital status	Number of children	Job	Buy?
1		A	150,000		1	Engineer	No
2	27	B	50,000			Teacher	No
3		A	100,000	Married	2		Yes
4	40	B			2	Engineer	Yes
5	35	B		Single	0	Doctor	Yes
6		A	50,000		0	Teacher	No
7	33	B	60,000	Single		Teacher	No
8	20	B	10,000			Student	No

# Imputation

- Fill missing fields with certain values
  - Defaults
    - E.g. 0, or the empty string, etc.
  - Statistical measures – mean, median, mode
    - e.g. if a day in July is missing its temperature value, fill it with the median temperature in July

# Imputation

- Fill missing fields with certain values
  - Defaults
    - E.g. 0, or the empty string, etc.
  - Statistical measures – mean, median, mode
    - e.g. if a day in July is missing its temperature value, fill it with the median temperature in July

Avoid filling missing values with possible values!

# Scaling

# Types of scaling

scaling type	use case
min/max normalization	Any -- no assumptions about variables
z-score normalization	When variables follow a normal distribution
log scaling	When variables follow an exponential distribution

# Log scaling

- Help with skewed data
- Often gives performance gain

# Scaling

scaling type	use case
min/max normalization	Any -- no assumptions about variables
z-score normalization	When variables follow a normal distribution
log scaling	When variables follow an exponential distribution

- scaling can be a common source of data leakage

# Scaling

scaling type	use case
min/max normalization	Any -- no assumptions about variables
z-score normalization	When variables follow a normal distribution
log scaling	When variables follow an exponential distribution

- scaling can be a common source of data leakage
- scaling variables requires global statistics

# Discretization

- Turning a continuous feature into a discrete feature (quantization)

# Discretization

- Turning a continuous feature into a discrete feature (quantization)
- Create buckets for different ranges
  - Incorporate knowledge/expertise about each variable by constructing specific buckets

# Discretization

- Turning a continuous feature into a discrete feature (quantization)
- Create buckets for different ranges
  - Incorporate knowledge/expertise about each variable by constructing specific buckets
- Examples
  - Income
    - Lower income:  $x < \$35,000$
    - Middle income:  $\$35,000 < x < \$100,000$
    - High income:  $x > \$100,000$

# Discretization

- Turning a continuous feature into a discrete feature (quantization)
- Create buckets for different ranges
  - Incorporate knowledge/expertise about each variable by constructing specific buckets
- Examples
  - Income
    - Lower income:  $x < \$35,000$
    - Middle income:  $\$35,000 \leq x < \$100,000$
    - High income:  $x \geq \$100,000$
  - Age
    - Minors:  $x < 18$
    - College:  $18 \leq x < 22$
    - Young adult:  $22 \leq x < 30$
    - $30 \leq x < 40$
    - $40 \leq x < 65$
    - Seniors:  $x \geq 65$

# Encoding Categorical Features

- Example: you want to build a recommendation system for Amazon
  - There are over 2 million brands that we need to recommend

# Encoding Categorical Features

How do we encode the different brands/vendors?

# Encoding Categorical Features

- one-hot encoding!

How do we encode the different brands/vendors?

# Encoding Categorical Features

- one-hot encoding!

How do we handle a new brand that wants to join Amazon?

# Encoding Categorical Features

- one-hot encoding!
- encode unseen brands with “UNKNOWN”

How do we handle a new brand that wants to join Amazon?

# Encoding Categorical Features

- one-hot encoding!
- encode unseen brands with “UNKNOWN”

Problem! “UNKNOWN” was not seen during training, so none of the products in this category are being recommended

# Encoding Categorical Features

- one-hot encoding!
- encode unseen brands with “UNKNOWN”

Fix – encode brands as themselves, group bottom-performing 1% of brands as “UNKNOWN”

# Encoding Categorical Features

- one-hot encoding!
- encode unseen brands with “UNKNOWN”
- Group bottom 1% of brands and newcomers into “UNKNOWN” category

# Encoding Categorical Features

- one-hot encoding!
- encode unseen brands with “UNKNOWN”
- Group bottom 1% of brands and newcomers into “UNKNOWN” category

Alert! Nike wants to join Amazon as a new vendor

# Encoding Categorical Features

- one-hot encoding!
- encode unseen brands with “UNKNOWN”
- Group bottom 1% of brands and newcomers into “UNKNOWN” category
- Problem – this treats all newcomers the same as unpopular brands on the platform

# Encoding Categorical Features

How do we implement a flexible method of handling new brands as they are introduced to our system?

# Encoding New Categories

1. Represent each category with its attribute
  - a. E.g. to represent a brand, use features: yearly revenue, company size, etc..
2. Hashing trick

# Encoding Categorical Features

- Hashing – use a hash function to hash categories to different indexes

# Encoding Categorical Features

- Hashing – use a hash function to hash categories to different indexes
  - e.g.  $\text{hash}(\text{"Nike"}) = 0$ ,  $\text{hash}(\text{"Adidas"}) = 27$ , etc...

# Encoding Categorical Features

- Hashing – use a hash function to hash categories to different indexes
  - e.g.  $\text{hash}(\text{"Nike"}) = 0$ ,  $\text{hash}(\text{"Adidas"}) = 27$ , etc...
- Benefits – you can choose how large the hash space is

# Encoding Categorical Features

- Hashing – use a hash function to hash categories to different indexes
  - e.g.  $\text{hash}(\text{"Nike"}) = 0$ ,  $\text{hash}(\text{"Adidas"}) = 27$ , etc...
- Benefits – you can choose how large the hash space is
- Drawbacks – two categories being hashed to the same index

# Encoding Categorical Features

# Encoding Categorical Features

- Choose a hash space large enough to reduce collisions
- Choose functions with properties beneficial to your use case
  - Locality-sensitive hashing

# Hashing Trick Takeaways

- Hashing trick considered “hacky” by academics
- Widely used in industry and in machine learning frameworks
- Useful in practice for continual learning in production

# Feature Crossing

- Combine two or more features to create a new feature

Marriage	Single	Married	Single	Single	Married
Children	0	2	1	0	1
Marriage & children	Single, 0	Married, 2	Single, 1	Single, 0	Married, 1

# Feature Crossing

- Helps models learn non-linear relationships between variables
- **Warning** – feature crossing can blow up your feature space
  - e.g. Feature A and B both have 100 categories → Feature A x B will have 10,000 categories
  - Need even more data to learn this new feature space
  - Blowing up feature space can increase risk of overfitting

Very common in RecSys & CTR with  
models like DeepFM and xDeepFM

# Positional Embeddings

- Popularized in [\*Attention is All You Need\*](#) paper
- Similar to word embeddings
  - Can be either learned or fixed

Word embedding matrix

emb for word "food" (index 0)

word  
embedding  
size

0.001	0.023	-0.003	0.004	...
0...	0...	-0...	0...	...
0..	-0...	-1	-0...	..
...	...	...	...	...

Vocab

food	i	you	are	....
0	1	2	3	....

Position embedding matrix

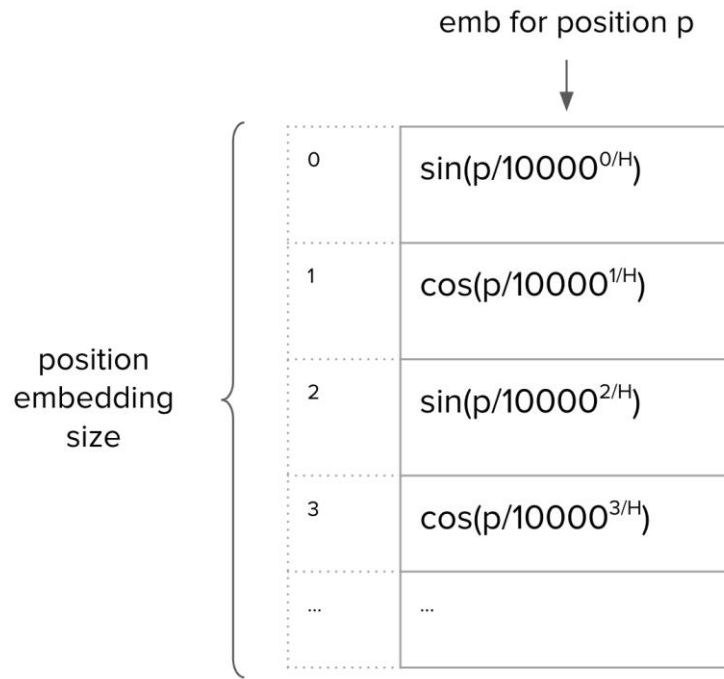

emb for position 0

position  
embedding  
size

0.001	0.0023	-0.003	0.004	...
0...	0...	-0...	0...	...
0..	-0...	-1	-0...	..
...	...	...	...	...

# Positional Embeddings

- Fourier features

# Positional Embeddings

Why do we need position embeddings?

# Positional Embeddings

Why do we need position embeddings?

- Traditional architectures (RNNs, LSTMs) process tokens sequentially
- Transformers process tokens in parallel → need to communicate sequential nature of human language to model

# Data leakage

# Data leakage

- Some form of the label “leaks” into the features
- This same information is not available during inference

# Data leakage: example 1

- Problem: detect lung cancer from CT scans
- Data: collected from hospital A
- Performs well on test data from hospital A
- Performs poorly on test data from hospital B

Patient ID	Date	Doctor note	Medical record	Scanner type	CT scan
------------	------	-------------	----------------	--------------	---------

# Data leakage: example 1

- Problem: detect lung cancer from CT scans
- Data: collected from hospital A
- Performs well on test data from hospital A
- Performs poorly on test data from hospital B

Patient ID	Date	Doctor note	Medical record	Scanner type	CT scan
------------	------	-------------	----------------	--------------	---------

At hospital A, when doctors suspect that a patient has lung cancer, they send that patient to a higher-quality scanner

# Data leakage: example 2

- Problem: predicting how many views an article will get
- Data: historical data on the site
- Where might data leakage come from?

Article ID	Date	Title	Article	Author	Language	Translations
------------	------	-------	---------	--------	----------	--------------

# Data leakage: example 2

- Problem: predicting how many views an article will get
- Data: historical data on the site

Not leakage because author popularity also available during inference

Article ID	Date	Title	Article	Author	Language	Translations
------------	------	-------	---------	--------	----------	--------------

The site only translate articles that are already gaining attention

The cat5 data (category with 10 open channels) is very similar to the addition of two signals of cat4 data, as several teams noticed. But also, we can find that the data from 4000001 to 4100000 (cat4) was used to create the data from 5700001 to 5800000 :  $\text{openchannels}(5700001:5800000) = \text{openchannels}(4000001 \text{ to } 4100000) + \text{openchannels of other cat4 data (that I didn't really look for)}$ . So we can just subtract data  $\text{openchannels}(4000001 \text{ to } 4100000)$  from the private LB data. Then we have cat4 data, much easier to predict. By using this method, we just reached a score of 0.9543. I guess by digging further, it can lead to the score of 0.985!
